1. Overview

LiveWord translates the preacher's speech in real time and shows subtitles at the same time on a projector and on the congregation's smartphones.

Feature	Description
Real-time translation	Subtitles appear as soon as the speaker finishes a sentence
Projector display	Dedicated screen with adjustable font size and colors
Phone access	Congregants view subtitles on their phones via a QR code
Per-phone language	Each person picks their own language on their own phone
Sermon script	Upload a PDF/Word script to improve translation accuracy
Glossary & name map	Improve name recognition; fix name translations (e.g. 요한=John)
Handout & poster	Print a congregant handout / poster with the QR and languages
Languages	English, Japanese, Chinese, Spanish, French, German, Arabic, Korean

2. Installation

1 Run the installer

Double-click `LiveWord_Setup.exe`. If a "Windows protected your PC" warning appears, click **More info** → **Run anyway**.

2 Choose the install location

Keep the default folder or choose another, then click **Install**.

3 Finish

A **LiveWord** icon is created on the desktop.

4 Clear the Windows security warning (first time only)

On first launch, Windows **Smart App Control** may block the app because it isn't code-signed. To allow it:

1. Click the Windows **Start** button
2. Search for "**Smart App Control**" and open it
3. Set it to **Off**
4. Double-click the **LiveWord** desktop icon again

💡 This is a one-time step; the app runs without warnings afterward.

⚠️ On first launch you must enter API keys. Read section 3 first and have your keys ready.

3. Getting API keys (one-time)

The app uses two external services. You need a key from each.

① Anthropic Claude API key (for translation)

1 Sign up

<https://console.anthropic.com> → **Sign Up** (or **Log In**).

2 Add a payment method & credits

Left menu **Billing** → **Add payment method** → enter card details → **Buy credits**.

💡 \$5–10 is plenty to start. A one-hour weekly service costs roughly \$2–5/month. Tip: turn on **Auto reload** so translation never stops mid-service.

3 Create the API key

Left menu **API Keys** → **+ Create Key** → name it → **copy the key** (`sk-ant-api03-...`) and save it in Notepad (you can't view it again after closing).

⚠️ An API key is like a password. Never share it or email it. If leaked, delete it and create a new one.

③ Google Cloud speech-recognition key

1 Create a project

<https://console.cloud.google.com> → project dropdown (top) → **New Project** → name it → **Create**, then make sure it's selected.

2 Link a billing account

Menu (≡) → **Billing** → **Link a billing account** → add a card. (Light usage may fall within the free tier.)

3 Enable Speech-to-Text API

Search **Cloud Speech-to-Text API** → click **Enable**.

4 Create a service account

Menu (≡) → **IAM & Admin** → **Service Accounts** → **+ Create service account** → name it → role **Cloud Speech Client** → **Done**.

5 Download the JSON key

Open the new service account → **Keys** tab → **Add key** → **Create new key** → **JSON** → **Create**. A `.json` file downloads — keep it.

⚠ The JSON key is like a password. Don't email or share it. If lost, delete it and create a new one.

③ ngrok account (for phone access)

1 Sign up

<https://dashboard.ngrok.com> → Sign Up (free)

2 Copy your Authtoken

Getting Started → Your Authtoken, copy the token.

3 (Optional) Get a fixed domain

Domains → New Domain — one free fixed domain lets you reuse the same QR every week.

4. First run — setup screen

1 Launch

Double-click the **LiveWord** desktop icon. A black console window opens and the server starts (don't close it).

2 Open the setup screen

An **operator app window** opens automatically (a standalone window with no address bar/tabs). If keys aren't set yet you'll see the setup screen; otherwise the operator dashboard. If nothing opens, type

`http://localhost:5000/setup` in a browser.

💡 On the setup screen, the "**Copy question → Open Claude**" buttons let free Claude (claude.ai) walk you through getting the API keys step by step.

3 Enter the Claude API key

Paste the `sk-ant-...` key and click **Test connection**.

4 Upload the Google key file

Use **Choose file** to select the downloaded `.json`, then **Test connection**.

5 ngrok settings

Enter the Authtoken and, if you have one, the fixed domain.

6 Save

Click **Save settings → Open operator dashboard**.

✓ Settings are saved in the program folder's `.env` file and applied automatically next time.

5. Weekly use

When	Task	How
Before	Launch	Double-click LiveWord (operator app window opens automatically)
Before	Upload sermon script (optional)	Left panel "Upload script" → pick PDF/Word
Before	Open projector screen	"► Open display window" → move to projector, go fullscreen
Before	Share the QR	Print it in the bulletin, or use "Handout / Poster" print
Start	Turn on mic	"🎤 Start mic" button
During	Watch subtitles	On the projector and on phones
During	Tidy the screen (optional)	"🧹 Clear screen" to wipe subtitles between segments
After	Turn off mic	"■ Stop mic" button
After	Quit	Close the console window or press Ctrl+C

6. Screens explained

Operator dashboard (/operator)

- **Open display window** — opens the projector subtitle screen (can be reopened anytime)
- **Start/Stop mic** — begin/stop interpreting. Changing the audio input device applies immediately.
- **🧹 Clear screen** — instantly wipes accumulated subtitles on the projector and all phones (handy between service segments)
- **Language** — change source / primary target language. Takes effect from the next sentence even mid-service.
- **Upload script** — a PDF/Word sermon script improves accuracy
- **Glossary** — add church-specific names to improve speech recognition. Uploading adds new words to the existing list (existing kept).
- **Name/term map** — fix how specific words are translated (format: 한글=English , e.g. 요한=John).
- **Display settings** — font size, text/background color (live on the projector)
- **QR / Handout · Poster** — the phone-access QR, plus buttons to print a **congregant handout (with QR)** and a **custom poster**

Projector (display) screen (/)

- Double-click or F11 — toggle fullscreen

- Subtitles stack upward; older lines scroll off the top
- Shows the operator's primary language

Congregant phone screen (/mobile)

- Connect by scanning the QR
- **Language picker** — each person can choose their own language (English, Chinese, Japanese, Spanish, French, German, Arabic, Korean)
- + / – buttons to adjust text size
- Keeps the screen awake automatically

Printables

- **Congregant handout** (/guide) — a one-page sheet with the QR, language selection, and how-to. Korean/English toggle; print or save as PDF.
- **Poster maker** (/poster) — **upload your church logo** and enter the church name & website; the poster is built with your branding. Logo/name are saved on this computer for next time. QR, languages, and title fill in automatically; prints on one Letter-landscape page.

7. FAQ

Q. Translation feels slow

Depending on internet speed and API load, expect a 0.5–3 second delay. A wired connection is recommended.

Q. Can each person see a different language?

Yes. After scanning the QR, each person taps the **language button** at the top of their phone screen. Different people can watch in different languages at once. The projector shows the operator's primary language.

Cost note: only languages that *someone actually selects* are translated. Unused languages cost nothing.

Q. How do I fix how a name/place is translated?

On the dashboard → **Name/term map**, add one per line as 한글=English (e.g. 요한=John).

Q. The screen is cluttered with old subtitles

Click 🗑 **Clear screen** on the dashboard to wipe the projector and all phones at once.

Q. I want a poster with our church logo

Dashboard QR area → 🖨 **Poster maker** → upload your logo, enter church name & website → print / save as PDF. Your logo and name are saved on this computer for next time.

Q. Names or place names are recognized incorrectly

Add them via **Glossary**. Format: one word per line in a `.txt`, `.pdf`, or `.docx` file. Uploading keeps the existing list and adds new words (duplicates removed automatically).

Q. Phones can't connect after scanning the QR

Make sure ngrok is set up. The QR area on the dashboard should show an address.

Q. I accidentally closed the black console window

Double-click the desktop icon again to restart the program.

Q. How do I change an API key?

Open `http://localhost:5000/setup` in a browser, enter the new key, and save.

Q. How much does translation cost?

Roughly \$2–5 for a one-hour weekly service. Check real-time usage in the Anthropic console.
